Project Information

Perkins hauled components of various size to a refinery in northern Wisconsin. The sizes of the components varied from legal size and weight, to 145' feet long, 14'06" diameter, weighing 105, 204 lbs. Perkins permit dimensions for the largest piece was 178' long, 12'06" wide, 15' high, and weighed 213,000 lbs. Perkins was contracted to haul the components un-insulated to a place where they were insulated, then transported to the refinery in Wisconsin.

The project required state, county, and city permits, as well as police and civilian escorts. Because of the size of the largest component, Perkins had circuitous routing to avoid construction, low bridges, weak bridges, and impossible turns.
